NaviNet® AllPayer™ APIs

Greater Connectivity, Interoperability, and Speed Across More Than 1,270 Health Plans

OVERVIEW

Payers and providers share concern over the tremendous volume of administrative interactions and transactions that still occur manually, adding inefficiencies to their workflow and potential delays in patient care.

- In the United States healthcare system, $83 billion is spent on administrative processes tracked by the CAQH Index. Of the $83 billion, the industry can save $18.4 billion, or 22% of existing annual spend, by transitioning to fully electronic transactions.[1]

THE SOLUTION

A suite of secure APIs (Application Programming Interfaces) that provide the ability for key stakeholders to connect to our more than 1,270 health plans securely within your own primary interface, helping you to more effectively scale your transactions.

With additional access options to the critical information, providers and third-party vendors can save time and realize additional efficiencies by leveraging APIs to get the key information they need.

KEY FEATURES

- Easily connect to and automate transaction sets for eligibility and benefits and claim status inquiry.

- A Health Insurance Portability and Accountability Act (HIPAA)-compliant gateway to health plans (Commercial, Medicare, Medicaid, and more) to share data more efficiently, while speeding the accuracy of billing and collection.

- Developer tools to access API details and easily connect and test.

KEY BENEFITS

- Providers and revenue cycle companies can increase efficiencies by providing consolidated, direct connections from their core EMR and billing systems to all payers, virtually eliminating manual or double data entry and outbound telephone inquiries. These workflows can be fully automated, allowing provider offices to focus on clinical priorities. This will improve speed and accuracy of billing and collection, while improving the member experiences, outcomes, and overall cost of care.

- Third-party vendors who serve our network of providers can connect to NaviNet to access and share data for enhanced payer-provider collaboration for revenue cycle management, care coordination, and value-based care.

- Health plans will be able to better serve their large providers with the rich information already available in the NaviNet portal, accessed automatically via the systems of their choice.

- The NaviNet API is a Software as a Service (SaaS) platform. Customers can be onboarded and up and running within a few days of implementation.

Drive Operational Costs Down

- **Securely reach 1,270+ health plans in real time, leading to more cost-effective workflows.**

- **Your applications only need to connect to our API gateway. We handle the health plan connectivity.**

- **By reducing outbound telephone inquiries and manual lookups, faster and more accurate billing and collection can result.**

- **NaviNet AllPayer APIs have the flexibility to evolve and expand as your business grows.**

PRICING

For pricing, please email us at ProviderSales@NantHealth.com.

NaviNet, one of America's leading payer-provider collaboration platforms, helps healthcare constituents keep pace with emerging technologies, addressing modern pain points and helping to define the future of care.
